

Project Design Phase
Proposed Solution

Date	
Team ID	
Project Name	Virtual Agent–Driven SLA Breach Awareness & Justification System
Maximum Marks	2 Marks

Proposed Solution :

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	IT support teams often fail to identify SLA risks before breaches occur. SLA violations are noticed late, breach reasons are not properly documented, and managers lack real-time visibility, resulting in poor accountability and reduced service quality.
2	Idea / Solution Description	Develop a Virtual Agent–Driven SLA Breach Awareness & Justification System on the ServiceNow platform. The system automatically detects SLA risks, notifies assignees through Virtual Agent and email, collects mandatory breach justifications, and provides dashboards and reports for managers to monitor SLA performance.
3	Novelty / Uniqueness	The solution combines SLA monitoring, Virtual Agent conversations, automated notifications, mandatory breach justification, and real-time dashboards into one integrated governance system. This improves accountability and enables proactive SLA management.
4	Social Impact / Customer Satisfaction	The solution improves IT service delivery by reducing SLA breaches, increasing transparency, ensuring timely communication, and enhancing customer satisfaction through faster issue resolution and better service quality.
5	Business Model (Revenue Model)	The solution can be implemented by organizations already using the ServiceNow platform as an enterprise ITSM enhancement. It adds value by improving operational efficiency, reducing SLA penalties, and supporting better governance without requiring additional manual processes.
6	Scalability of the Solution	The solution is highly scalable and can support multiple departments, teams, and thousands of incidents. It can be extended with additional workflows, dashboards, notifications, and AI capabilities as organizational requirements grow.
