Project Name	Virtual Agent–Driven SLA Breach Awareness & Justification System
Maximum Marks	4 Marks

Solution Architecture:

The proposed solution is built on the ServiceNow platform using a modular architecture that integrates Incident Management, SLA Management, Flow Designer, Virtual Agent, Notifications, and Platform Analytics. The system continuously monitors SLA status, automates user interactions and notifications, stores breach justifications, and provides real-time dashboards for effective SLA governance and decision-making.

Key Components:

1. SLA Monitoring Layer – Tracks incident SLAs continuously and detects SLA risk or breach conditions.
2. Automation Layer – Uses Flow Designer and Virtual Agent to send alerts, collect breach justifications, and automate workflows.
3. Data Management Layer – Stores incident details, SLA status, acknowledgements, and breach reasons securely in ServiceNow tables.
4. Analytics & Reporting Layer – Displays real-time dashboards, reports, and performance metrics for managers to monitor SLA compliance and improve service quality.
