

Project Design Phase-II

Data Flow Diagram & User Stories

Date	
Team ID	
Project Name	Virtual Agent–Driven SLA Breach Awareness & Justification System.
Maximum Marks	4 Marks

Data Flow Diagrams:

The Data Flow Diagram (DFD) illustrates how information moves through the Virtual Agent–Driven SLA Breach Awareness & Justification System. It provides a visual representation of the interactions between users, the Virtual Agent, ServiceNow Incident records, Flow Designer, Notifications, and Dashboard components. The DFD helps stakeholders understand how data is collected, processed, validated, stored, and presented throughout the SLA governance lifecycle.

Data Flow Process

Step 1: User creates or updates an Incident in the ServiceNow Incident table.

Step 2: The system continuously monitors the Incident SLA status.

Step 3: The system checks whether the SLA is approaching its breach threshold.

Step 4: If the SLA is **not at risk**, the incident continues through the normal resolution process.

Step 5: If the SLA **is at risk**, Flow Designer is automatically triggered.

Step 6: Flow Designer launches the Virtual Agent conversation with the assigned support engineer.

Step 7: The Virtual Agent notifies the assignee about the potential SLA breach and requests acknowledgement.

Step 8: If the SLA is breached, the Virtual Agent prompts the assignee to provide a mandatory breach justification.

Step 9: The assignee submits the breach reason and any additional comments.

Step 10: The system validates and stores the justification in the Incident record.

Step 11: Flow Designer automatically sends an email notification to the manager with the breach details.

Step 12: Platform Analytics updates reports and dashboards using the latest incident and justification data.

Step 13: Managers review SLA performance, breach trends, pending justifications, and take corrective actions if required.

Step 14: The process ends after the incident is resolved and all SLA governance activities are completed.

User Stories :

User Story 1 – IT Support Engineer

As an IT Support Engineer, **I want** to receive proactive SLA breach notifications from the Virtual Agent **so that** I can take corrective action before the SLA is violated and minimize service disruptions.

User Story 2 – Incident Manager

As an Incident Manager, **I want** to receive automated alerts whenever critical incidents are at SLA risk **so that** I can monitor progress, escalate issues, and ensure timely resolution.

User Story 3 – Service Desk Manager

As a Service Desk Manager, **I want** to view real-time dashboards showing SLA breaches, trends, and justification status **so that** I can analyze team performance and improve SLA compliance.

User Story 4 – System Administrator

As a System Administrator, **I want** to automate SLA notifications, justification collection, and reporting **so that** the organization maintains accountability, reduces manual work, and remains audit-ready.

By implementing these user stories, the project delivers a proactive SLA governance solution that increases accountability, improves communication between stakeholders, reduces SLA violations, simplifies audit processes, and enhances overall IT service management efficiency.

Virtual Agent–Driven SLA Breach Awareness & Justification System
